

Dear future intern,

You were worried that this is an outdoorsy job! Well, today I picked up a dead, young ground hog, most likely killed by leashless dogs (a problem with this area.) Now, you've seen the box-wire structure next to the compost boxes. Many know that structure for sequeing compost, however it is as well a burial ground for our ground hog. He was buried there today, on June 17<sup>th</sup>, 2013, to be eaten by decomposers and turn into merely a skeleton inside his burial bag. It is your task to retrieve the groundhog skeleton, to show the students. Happy digging.

**Spring 2013**

- Julia Gogoleva,  
intern from the past.
